# Discussion Points

- We have enough properties in the pipeline to supply PDIs for the 2009 and part of 2010 construction season. Need to start adding to PDI required pool.
- Approximately 3,590 properties need visit ranging from initial investigation to return for visual characterization:
  - 750 need CSS
  - 2040 PDI Not Required
  - 800 of 955 Removal Completes will need revisit for visual (all removals in 2006 or earlier)
- Potentially the 303 B1/B2 under “Pending” could be moved into PDI required per latest science results
- Will need to feed in Troy properties into the investigation and removal process in the coming years

# Proposed Path Forward

- Prioritize 3,590 properties needing a visit (or revisit) based upon potential risk
  1. Highest potential risk – 750 properties needing initial investigation
  2. Medium potential risk – 2040 properties with some initial investigation (includes 303 B1/B2)
  3. Low potential risk – 800 properties with “removal complete” that may or may not contain visual
- Advantages of this approach
  - Builds risk into path forward for property selection to ensure risk is reduced to the maximum extent with constrained resources
  - Leverages uncertainty of remaining science to ensure minimum number of revisits that disrupt homeowners

## ASSUMPTIONS

- Typical average yearly cleanup flow for a season
  - 225 PDIs
  - 200 Designs
  - 175 Removals
